A VLAN defines a collision domain. B. A VLAN defines a broadcast domain. C. Broadcasts are flooded to all VLANs. D. Collisions are flooded to all VLANs. E. A Layer 3 device is required to route packets between VLANs. F. A Layer 2 device is required to route packets between VLANs. Answer: BE Explanation: "In computer networking, a single layer-2 network may be partitioned to create multiple distinct broadcast domains, which are mutually isolated so that packets can only pass between them via one or more routers; such a domain is referred to as a virtual local area network, virtual LAN or VLAN." "A router (Layer 3 device) serves as the backbone for network traffic going across different VLANs." http://en.wikipedia.org/wiki/Virtual_LAN QUESTION 80 Which device would you select to partition a network into VLANs? Which mode should be configured on this switch? A. client B. transparent C. server D. neutral Answer: B QUESTION 89 What action does a switch take if the destination MAC address is unknown? A. Discard frame B. Send ICMP unreachable message to source C. Flood packet on all ports D. Compare destination IP address against an ACL to determine if it is permitted E. Send gratuitous ARP on all ports and wait for reply before forwarding Answer: C Explanation: "What happens though when the switch receives a frame with a destination MAC address that is not included in the table? In that case the switch will just broadcast/flood the frame with the unknown destination address to all of its ports (apart from the port where the frame came from). This process is called unknown unicast flooding." <http://telconotes.wordpress.com/2013/03/09/how-a-switch-works/> Lead2pass is a good website that provides all candidates with the latest IT certification exam materials.
